

Latest dairy research

- Eight years (2013-2020) of research at Moorepark.
- Grass-only grazing system receiving 250 kg fertiliser N/ha per year.
- grass-white clover system receiving 150 kg N/ha per year.
- Both grazing systems were stocked at 2.74 cows/ha.

3

Table 1. Average herbage production, sward white clover content and milk production of a grass-only sward receiving 250 kg N/ha and a grass-white clover sward receiving 150 kg N/ha at Moorepark from 2013-2020, and of grass-only and grass-white clover swards receiving 250 kg N/ha at Clonakilty from 2014-2017

	Moorepark		Clonakilty	
	Grass-only 250 kg N	Grass-white clover 150 kg N	Grass-only 250 kg N	Grass-white clover 250 kg N
Stocking rate (cows/ha)	2.74	2.74	2.75	2.75
Annual herbage production (t DM/ha)	13.5	13.4	15.6	16.8
Silage fed during lactation (kg DM/cow)	259	333	350	430
Average sward clover content (%)	-	22.0	-	23.1
Milk solids yield per cow (kg)	490	510	437	485
Concentrate fed (kg/cow)	438	438	391	391
Net profit (€/ha)	1,974	2,082	2,369	2,674

Δ

Nitrogen fixation

Nitrogen fixation is the process whereby white clover can fix N from the atmosphere and make it available for plant growth through a process called biological N fixation.

This N is then available for uptake by white clover and other plants, mainly perennial ryegrass, in the sward.

5

The quantity of N fixed by a grass white-clover sward depends on a number of factors including:

- Sward white clover content N fixation increases as clover content increases.
- N fertiliser application rate N fixation declines with increasing N application.
- Soil temperature N fixation increases as soil temperature increases.
- Solar radiation (sun light) more sunlight, more fixation.

fertiliser application rate (kg N/ha)	Quantity of N fixed in grass white clover swards (kg N/ha)	
100	100-150	
150	90-130	
200	70-100	
250	0-40	

How does white clover grow?

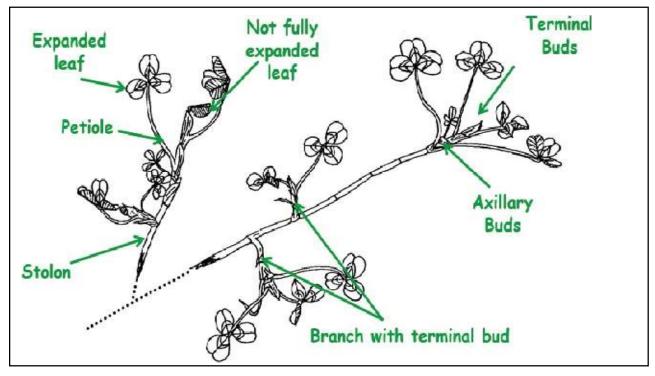

• There are three stages of white clover growth from germination to full establishment. These are:

Expansion phase Rosette phase Clonal phase Reliant on central taproot No taproot. Reliant on adventitious •Reliant on central taproot roots which form at the nodes of the •Rapid expansion – up to 15 Few branches stolons branches, 25-30 cm in size •Small spread Normal status of clover in •Initially rooting is poor on the Rosette plant form established swards (Figure 1) stolons and careful grazing is •Plant size - 10-20 cm Clover actively fixing N required to avoid damage Phase lasts approx. three months •Six months post-sowing roots Stolons last for •Clover does not fix N in this phase 12-18 months. New stolons produced strengthen but plant still reliant on Important to graze during this central taproot for nutrient uptake at the terminal bud phase to promote growth (without •12 months post-sowing taproot New stolons become independent damaging plant) begins to die plants and this cycle continues each - can take up to 2.5 years for all year taproots in the sward to die •Good grazing management helps •12-18 months post-sowing N maintain stolon production and white fixation begins clover persistence in grazing swards •Good grazing management is crucial for stolon development

Grazing management for white clover swards

Spring

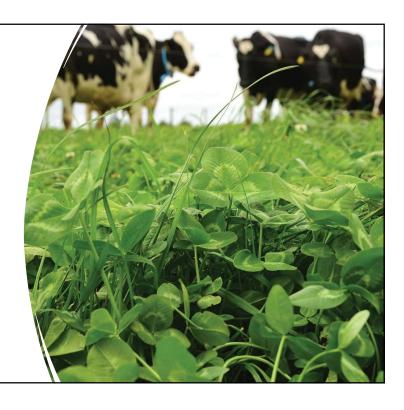

- Target early spring grazing this benefits white clover growth
- Avoid poaching/damaging swards – poaching reduces white clover content in the sward
- Be flexible use on/off grazing, graze wetter paddocks in drier weather, etc.
- Target post-grazing sward height of 3.5 cm

11

Mid-season (April to July)

- Maintain pre-grazing herbage mass between 1,300 and 1,600 kg DM/ha (8 to 10 cm)
- Target post-grazing sward height of 4.0 cm
- Chemical N fertiliser may be reduced on swards with good white clover content (≥ 25%) (see Figure 2 for guideline sward clover content and section on N fertiliser strategies)

Autumn Avoid poaching/damaging swards Be flexible – use on/off grazing, graze wetter paddocks in drier weather, etc. Chemical N fertiliser may be reduced in August on swards with good white clover content (≥ 25%) (section on N fertiliser strategies below) Close paddocks with a high sward white clover content (i.e. > 30%) towards the end of the final rotation (end of October to start of November)

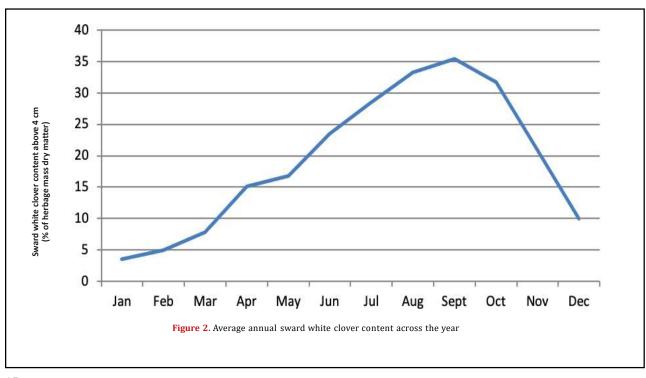

rotation length

13

 An average annual sward white clover content of approx.

Build grass on the farm from early to mid-August by extending

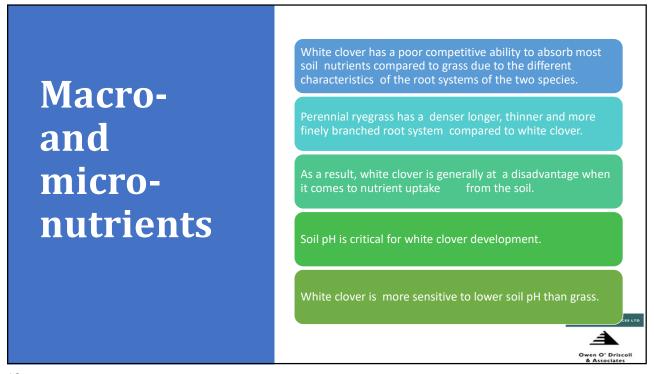

- 20 25% is desirable for animal and sward production benefits.
- Sward white clover content increases through the spring, into summer and generally peaks in August/September (Figure 2).
- Good grazing management is key to maintaining sward white clover content.

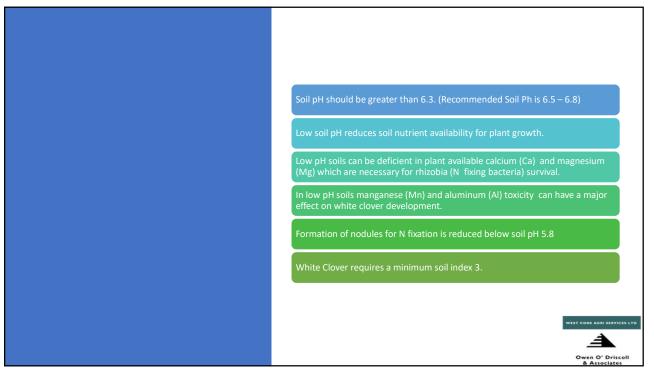

White clover does not have the ability to fix N for the first 12 to 18 months post-sowing. Nitrogen fertilizer is important during this period to encourage growth and development. White clover needs a higher soil temperature for growth than grass. Grass starts growing at soil temperatures of 5-6°C while white clover needs soil temperature of 8°C. As a result, the contribution of white clover to the sward in early spring is low. As our systems have a requirement for pasture to feed animals in early spring, N fertiliser must be applied at similar rates to those used in grass-only swards

Date (rotation)	N fertiliser application (kg N/ha)
Mid-late January	28
Mid-March	28
April (2 nd rotation)	33
Early-May (3 rd rotation)	9

Establishing a grass-white clover sward on your farm

Over-sowing is a simple and low cost method of introducing white clover into swards.

Success is very much dependent on soil fertility, weather conditions at sowing, soil moisture, post-sowing grazing management and competition from the existing sward.

21

Use grass and white clover varieties from the Irish Recommended List. Cattle sowing rate - 28 to 30 kg/ha of grass plus 3.5 to 5.0 kg of medium leaved clover. Sheep sowing rate - 25 to 28 kg/ha of grass plus 5.0 to 6.0 kg of small leaved clover. Avoid sowing white clover seed too deep - sowing depth approx. 10 mm. Roll well to ensure good contact between the seed and the soil.

Do not over-sow old 'butty' swards with a low content of perennial ryegrass – white clover will not establish well in these.

Control weeds before over-sowing white clover as weed control options afterwards are more limited.

Some herbicides have a residue of up to 4 months – always check the residual time on the label of the product or seek advice on a suitable weed control product.

23

Over - sowing

Take a representative soil sample for P, K and pH analysis and correct soil fertility prior to over-sowing.

Optimum soil fertility when oversowing will help increase the chances of success.

White clover seed can be broadcast onto the sward or stitched in using a suitable machine.

25

Over - sowing

Over-sow directly after grazing (≤ 4 cm post-grazing sward height) or after cutting the paddock for surplus bales – ideally only over-sow three to four paddocks at a time.

Sow at a rate of 4.0 to 6.0 kg of white clover seed/ha.

Soil contact post over-sowing is one of the most crucial factors affecting germination.

- Roll paddocks post-sowing to ensure soil contact.
- Apply watery slurry (if available) ideally around 2000 gallons/ac.

Reduce N fertiliser post over-sowing for one to two rotations to reduce grass growth.

Broadcasting with a fertiliser spreader:

Mix clover seed with 0:7:30 fertiliser and only add white clover to the spreader when you are in the field to avoid white clover settling at the base of the spreader.

Do a maximum of 1 ha at a time (to avoid seed settling) and spread in 2 directions across the field.

27

•Weeds in new reseeds are best controlled · Control established weeds before overwhen grass is at the two to three leaf sowing as weed control options post-sowing will be limited. Weed control • Docks and chickweed are two of the most · Consider residue time of non- clover safe in reseeded critical weeds to control; it is important to sprays from application of spray to overand over-sown control these at the seedling stage. When sowing the white clover - it can vary from grass-white white clover is included in the sward use a one to four months. clover safe herbicide clover swards • For established grass-white clover swards the herbicides Eagle and Prospect are white clover safe options. •All pesticide users should comply with the regulations as outlined in the Sustainable Use Directive (SUD).

Grazing management to prevent bloat

Bloat can be an issue in swards with high white clover content.

Bloat can occur at any time of the year, but it is more likely to occur in the second half of the year when white clover content in the sward is highest.

Good grassland management can minimise and prevent the risk of bloat.

29

Bloat prevention

- Avoid switching between grass-only and grass-white clover swards (as much as is possible).
- · Keep post-grazing sward height at 4 cm, not below.
- When entering a grass-white clover paddock in risky conditions (high white clover content / hungry animals / wet morning / very lush pasture) provide a small area in the paddock for the first 2-3 hours after turn-out to prevent the initial gorging on white clover.
- Provide anti-bloating agent in the water supply starting the day prior to entering the risky paddock.
- Check cows after initial turnout and regularly for first three hours of grazing during high risk periods.

Owen O' Driscoll

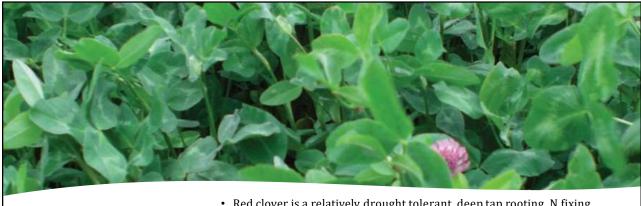

White clover varieties

- White clover cultivars are categorised by leaf size.
- Small leaf white clover
- Lower yielding
- More persistent
- Tolerant of tight grazing, e.g. sheep grazing
- Medium leaf white clover
- Intermediate for yield and persistency
- Suitable for cattle grazing

31

White Clover Varieties

- Large leaf white clover
- Higher yielding
- Aggressive and can dominate a sward
- Include in silage swards
- Small leaf white clovers are recommended for sheep grazing and medium leaf white clovers for dairy or beef cattle grazing

Red clover

- Red clover is a relatively drought tolerant, deep tap rooting, N fixing legume that is primarily used for silage production but can also be grazed by cattle or sheep in the autumn.
- It offers high yields of high-quality forage and can fix 150-200 kg N/ha per year.
- Red clover has a different growth habit to white clover and requires different management to optimize its performance.

33

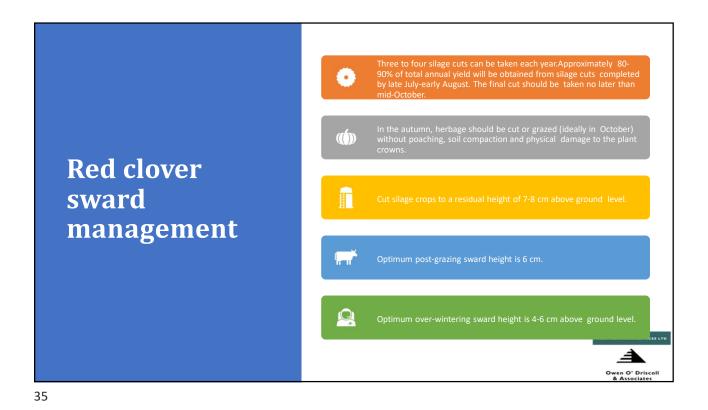

Red clover sward management

Red clover seeding rate - 20 to 22 kg/ha of grass seed plus 7 to 10 kg/ha of red clover seed. White clover can also be added to the mix at a rate of 1 kg/ha if required.

In the establishment year, red clover should be allowed to flower before harvesting the first cut of silage to help root development and the growth of the bacteria that fix N.

In subsequent years, silage harvesting should occur at intervals of six to eight weeks, any time between bud development and early flowering.

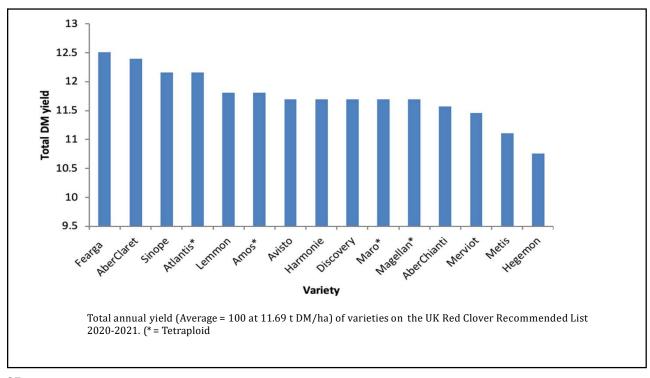

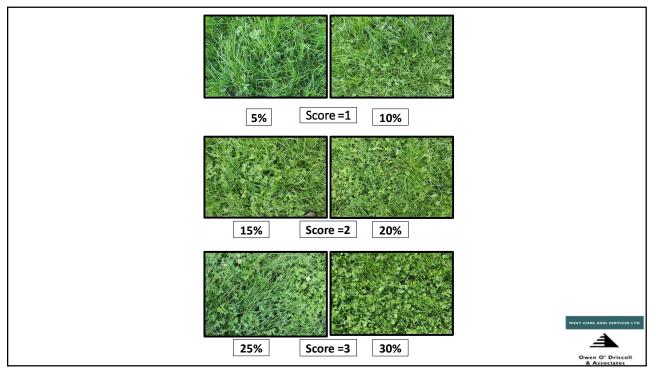

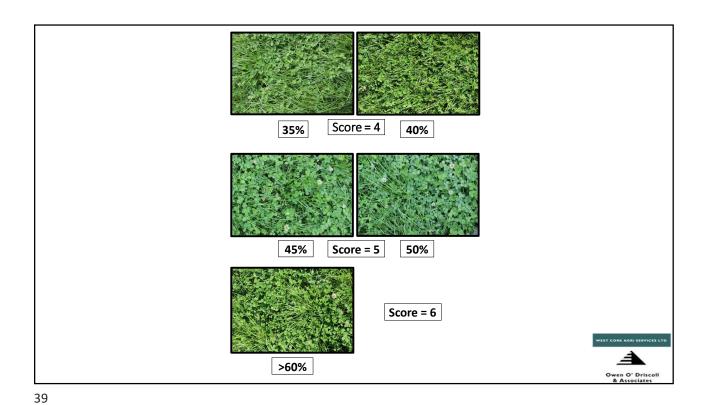

Red clover varieties

- There are no official red clover evaluation trials in Ireland so red clover varieties are not included in the Recommended List of Grass and Clover Varieties published by the Department of Agriculture, Food and the Marine each year.
- Therefore, the United Kingdom (UK) Recommended List of Red Clover Varieties should be used when selecting a red clover variety
